

DevStash

A developer knowledge hub for snippets, commands, prompts, notes, files, images, links and custom types.

Context Files

Read the following to get the full context of the project:

- @context/project-overview.md
- @context/coding-standards.md
- @context/ai-interaction.md
- @context/current-feature.md

Commands

```
npm run dev      # dev server (Turbopack) on :3000
npm run build    # production build; also runs the TypeScript check
npm run start    # serve the production build
npm run lint     # bare `eslint` (not `next lint`)
npx tsc --noEmit # type check on its own
```

There is no test runner configured and no test files. Adding one is a green-field decision — don't assume Jest/Vitest conventions exist.

Stack

Next.js 16.3.1 (App Router, Turbopack), React 19.2, TypeScript strict, Tailwind CSS v4.

Architecture notes

`src/app/` holds the entire app — `layout.tsx` (root layout, required, owns `<html>/<body>`) and `page.tsx`. Import alias `@/*` maps to `./src/*`.

Read `node_modules/next/dist/docs/` before writing Next.js code. This is v16 and the conventions differ from older App Router material. Two that bite immediately:

- **Route props helpers.** `PageProps<'/route'>` and `LayoutProps<'/route'>` are *global* types — no import. They're generated by `next dev`, `next build`, or `next typegen`, so a clean checkout won't typecheck until one of those has run. `layout.tsx` already uses `LayoutProps<"/">`.
- **params/searchParams are Promises** and must be awaited.

Tailwind v4 has no `tailwind.config.js`. It's wired through PostCSS (`postcss.config.mjs` → `@tailwindcss/postcss`) and configured *in* CSS via `@theme` / `@theme inline` blocks in `src/app/globals.css`. Don't create a JS config file.

Deliberate current state

This was a create-next-app scaffold that has been stripped on purpose. Do not "restore" any of it:

- `globals.css` is intentionally only `@import "tailwindcss";` — no reset, no color variables, no `body` rule.
- No Tailwind utility classes are used anywhere yet.
- `public/` does not exist. Recreate the directory if static assets are needed; Next.js picks it up with no config.
- `layout.tsx` defines the Geist font CSS variables on `<html>`, but nothing consumes them right now. Wiring them up means either a `font-family` rule in `globals.css` or a `@theme` mapping plus a utility class.
- `src/app/favicon.ico` is still the stock Next.js logo.
